

ABSTRACT

5 A fluid processing assembly can be easily
inserted into and removed from a rotatable centri-
fuge channel. The processing assembly comprises a
processing container and a carrier. The processing
10 container has flexibility and, in use, occupies
the channel to receive fluids for separation in
the centrifugal field. The carrier retains the
processing container outside the channel in a
flexed condition conforming to the channel. The
carrier resists deformation of the processing con-
tainer during its insertion into or removal from
the channel.
